WPI; 1996-384442/38. N-PSDB; AAT40259, AAT40260.

New DNA encoding two forms of the human obesity gene product - and related vectors and transformed cells, used to produce recombinant proteins for treating obesity.

Claim 4; Page 23; 30pp; English.

The sequences given in AAW00301-02 represeent two forms of the human obesity protein, ob, in which Ala27Gln28 in AAW00301 are replaced by a single Thr in AAW00302. The nucleic acid sequences were isolated from a human fat cell cDNA library using the primer sequences given in AAT40261-64. The ob proteins are pref. expressed with a dipeptide leader sequence of Met-Arg or Met-Tyr. Experiments have suggested that the ob proteins are released by peripheral adipose tissue and are capable of controlling weight gain in normal and obese mice. The ob proteins are thought to be

for health or cosmetic reasons in obese humans, or to produce leaner food animals. Antagonists of GBP (including antibodies) are useful for increasing body weight, e.g. for treating weight loss associated with cancer, or for cosmetic reasons in humans, or for production of Kobe beef or Foie gras in domestic animals. OBP antibodies (Ab) can also be used in diagnostic immunoassays for the presence of GBP. The formation of Ab-OBP complexes enables in vitro evaluation of levels of GBP in a sample, especially to detect diseases associated with elevated or decreased levels, and to monitor treatment of these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A novel pharmaceutical composition comprises an obesity protein, e.g. the present sequence, together with sucrose and/or trehalose. The composition can be used to treat obesity and associated disorders, e.g. diabetes,

OBP (also known as leptin) is a hormone involved in the regulation of body weight. This sequence has effects on both food intake and energy expenditure. OBP and its analogues are useful for modifying body weight (optionally combined with known medicaments), for treating diabetes, high blood pressure or high cholesterol. The DNA encoding this sequence (and sequences complimentary to it) can be used in gene therapy for modifying body weight. This protein can be used for reducing weight

deptin analogues comprise this sequence having at least one substitution as featured above. A glutamine residue may be present at position 28 (see AAVS2712) or absent as in this sequence. A claimed method for preventing the loss of lean tissue mass associated with improper nutrition comprises administering to a mammal a leptin receptor ligand. The leptin receptor ligand is preferably a human leptin receptor agonist, such as the present sequence. Binding of the leptin receptor inhibitor leads to an increase of leptin production and a consequent increase in body mass. The method can be used for therapy in catabolic states such as cachesta resulting from illnesses such as anorexia and malnutrition. Methods of increasing lean tissue growth are also useful in the fields of veterinary science and animal husbandry in benefiting the health and quality of livestock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

The invention relates to a novel dextran-leptin conjugate comprising at least one low molecular dextran moiety, of 1-20 kDa, attached to at least one leptin moiety. The leptin moiety is preferrably the mature human OB protein (AAY83768). That leptin moiety is preferrably the mature human OB protein. Alternatively the leptin may be a homeologue of the human OB protein. Alternatively the leptin may be a homeologue of the human OB protein. This sequence corresponds to the catran-leptin conjugates can be used for weight modulation, treatment or prevention of diabetes, especially Type II, blood lipid reduction, e.g. hyperlipidemia, increasing lean body mass and increasing insulin conjugates may also be used in combination therapies, e.g. prior to heart surgery or liposuction. The dextran-leptin conjugates ensitivity. The conjugates may also be used in combination therapies, e.g. prior to heart surgery or liposuction. The dextran-leptin conjugates have improved efficacy, longer plasma circulation time, and no kidney vacuole formation. Hey also have improved solubility and minimal injection site reactions. (Note: this sequence is not given in the specification but is generated from information given by the inventors)

The invention relates to a dual-PEGylated leptin bioconjugate comprising two polyethylene glycol (PEG) moieties attached site-specifically at two coations in a leptin protein. The invention also provides a site-directed poly-PEGylation strategy for proteins which results in directed poly-PEGylation strategy for proteins which results in chomogenous preparations, and can be used with other biologically active agents including a variety of growth factors and peptide hormones. In leptin, a serine to cysteine substitution was engineered into the protein cat position 77 (relative to the wild-type mature sequence, AAY97871), and the S77 leptin analogue was PEGylated at the engineered cys residue and at the N-terminus. Leptin is a protein which has been shown to cause at the N-terminus. Leptin is a protein which has been shown to cause weight loss in animals, indicating that it will be useful for causing weight loss in humans. However, these studies also indicate that leptin confluence to be administered chronically and in a high concentration in would need to be administered chronically and in a high concentration for midividual, forms precipitates at the injection site, which into midividual, forms precipitates at the injection site, which criggers an inflammatory response. The leptin bioconjugate of the injection site, as seen with prior at leptin compositions. The dual-PEGylated leptin conjugates are used to effect weight cleptin. The dual-PEGylated leptin conjugates are used to effect weight leptin. The dual-PEGylated leptin conjugates are used to effect weight coless, and may also be used to treat type II diabetes and hyperlipidaemia.
                                                                                    New dualPEGylated-leptin bioconjugate useful for treating obesity and diabetes has polyethylene glycol conjugated to two specific sites on the
                                                                                                                                                                                                                                                                                                                                                                                                                                          Leptin analogue; human; polyethylene glycol; site-specific PEGylation; obesity; anorectic; type II diabetes; antidiabetic; hyperlipidaemia; antilipaemic; mutant; mutein.

Leptin 1-145. This is a natural variant of human leptin 1-146 (see
AXY95786) in which residue Gln-28 is absent. The invention is directed to
glycosylated leptin proteins that have a Stokes' radius greater than that
of naturally occurring human leptin. Preferred glycosylated leptins have
look naturally occurring human leptin. Preferred glycosylated leptins have
glycosylation sites at amino acid positions 4, 8, 23, 43, 46, 47, 68, 69,
look of the present sequence to provide
glycosylation sites at amino acid positions 4, 8, 23, 43, 46, 47, 48, 47, 48, 48, 100, 101, 102, 117 and 140, especially 46, 68, 47, 48, 48, 50, 100, 101, 102, 117 and 99, 101, or 2 + 46 + 68, 117, 68 +

The present sequence is a mature human leptin protein. Leptin is also known as obesity protein (OB protein). This protein may be used as the biologically active agent for use in the present invention. Note: this sequence is not shown in the specification, but is derived from information given by the inventors about SEQ ID 1 (AAB1265)
as well as vectors and prokaryotic (especially bacterial) or eukaryotic (especially human, monkey, BHK and CHO) host cells useful for recombinant production of the glycosylated leptins. The glycosylated leptins or nucleic acids encoding them, are used in the treatment of obsalty, diabetes and the effects of high blood lipid content (claimed). They have longer systemic circulation times in vivo than native leptins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for sustained delivery of biologically active agent, comprises biodegradable pH/thermosensitive polymeric matrix containing the biologically active agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for the treatment of metabolic abnormalities associated with lipoatrophy or acquired form of the lipoatrophy disease, where a leptin (1), its analogue or derivative is used. (I) has antilipaemic, antidiabetic, antiarteriosclerotic and vasotropic activities, and can be used in gene therapy. (I) can be used for the treatment of metabolic abnormalities associated with lipoatrophy or acquired form of the lipoatrophy disease related to treat the HIV positive patient with highly active antiretroviral therapy (HAART); for determining a predisposition of a lipoatrophic patient to respond to treatment with (I), its analogue or derivative; in hormone replacement therapy in lipoatrophic patients having reduced serum concentration of leptin; in gene therapy. The metabolic abnormalities associated with lipoatrophy includes hypertylycaemia, dyslipidaemia, hyperthipidaemia, hyperthipidaemia,

Increasing lean tissue content by using obesity protein analogue cosmetic use, to improve athletic performance, increase insulin sensitivity, overall body strength and decrease bone resorption. Claim 1; Page; 50pp; English.

- for

AAW34394-W34401 represent mutations and truncations of the mouse and human obseity (OB) proteins shown in AAW22434 and AAW22435. The OB proteins, and these mutations can all be used in the method of the invention. The method of the invention is for increasing lean tissue mass by administration of an OB analogue. The OB proteins are used for cosmetic applications, to improve athletic performance or as adjunct to surgery (e.g. liposuction or implant surgery, cardiac surgery, treatment of broken bones etc.). OB proteins also increase insulin sensitivity and overall body strength, and decrease bone resorption, e.g. for treating coverall body strength, and decrease bone resorption, e.g. for treating coverall body strength, and decrease bone resorption, e.g. for treating coverall body strength, and decrease bone resorption, e.g. for treating coverall body strength, and decrease bone resorption, e.g. for treating coverall as increased, increased by osteoporosis. Also red blood cell production is increased, increasing mental as well as physical profused in the side effects associated with use of anabolic steroids, growth hormone the side effects associated with use of anabolic steroids, growth hormone etc. Chemical modification of the OB protein (e.g. by attachment to a

The invention relates to a dual-PEGylated leptin bioconjugate comprising two polyethylene glycol (PEG) moieties attached site-specifically at two conversions in a leptin protein. The invention also provides a site-directed poly-PEGylation strategy for proteins which results in directed poly-PEGylation strategy for proteins which results in compensus preparations, and can be used with other biologically active cagents including a variety of growth factors and peptide hormones. In leptin, a serine to cysteine substitution was engineered into the protein cat position 77 (relative to the wild-type mature sequence, AAY97871), and the N-terminus. Leptin is a protein which has been shown to cause the N-terminus. Leptin is a protein which has been shown to cause weight loss in humans. However, these studies also indicate that leptin would need to be administered chronically and in a high concentration formulation to effectively treat obesity in humans. Leptin is insoluble

at physiologic pH at relatively high concentrations, and when injected into an individual, forms precipitates at the injection site, which triggers an inflammatory response. The leptin bioconjugate of the invention provides leptin in a form which allows high dosage without the invention provides leptin in a form which allows high dosage without the provides of leptin precipitates and associated inflammatory response at the injection site, as seen with prior art leptin compositions. The dual-psylated leptin molecule is large enough to avoid glomerular filtration and hence kidney vacuolation as seen with a single 20 kDa PEG conjugated leptin. The dual-PEGylated leptin conjugates are used to effect weight loss, and may also be used to treat type II diabetes and hyperlipidaemia. Sequences ANY97899-Y97893 represent specifically claimed human mature leptin analogues which may be dually-PEGylated according to the invention. Note: The present sequence is not shown in the specification, but is derived from the mature human leptin sequence given on page 12

This is the macure, recombinant method, number leptin 1-145, which is a variant of the Library number method for determining the predisposation of an obesit on 28. The claimed method for determining the predisposation of an obese individual to respond to leptin, leptin analog or derivative treatment comprises determining if the leptin analog or derivative treatment, and ascertaining if the leptin level is in the bottom 25 or 33 percent of leptin levels of coses individuals. The thu-Leptin 1-146 or 1-15 (see AAY92262) or other analogues (e.g. AAY92263-66) may be used in treatment. The method can be used as a screening tool to determine the likelihood that an obese individual (i.e. an individual with a body mass index of greater than 27) not having co-morbidities of obesity, such as administration with weight loss. Leptin is used for weight modulation (especially weight reduction), treatment of diabetes, blood lipid as well as the treatment of conditions associated with fertility, wound healing, hematopoletic conditions, angiogenic conditions and chronic etress conditions. Prescreening an individual prediction, more associated with fertility means the treatment of conditions and individuals predisposition to respond
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QQILTSMPSRNVIQISNDLENLRDLLHVLAFSKSCHLPWASGLETLDSLGGVLEASGYST 120

AAM90514 and AAW90515 represent variants of the murine and human obesity polypeptides (OBP), respectively. These sequences lack the Gln residue colypeptides (OBP), respectively. These sequences lack the Gln residue content at position 49 of the wild type sequences (represented by AAR92719 and AAR92720 respectively). OBP (also known as leptin) is a charmone involved in the regulation of body weight. This sequence has creaseful for modifying body weight (optionally combined with known medicaments), for treating diabetes, high blood presence or high cholesterol. The DNA encoding this sequence (and sequences complimentary coil) can be used in agent therapy for modifying body weight. This opese humans, or to produce leaner food animals. Antagonists of OBP colinoing antibodies) are useful for increasing body weight, e.g. for treating weight loss associated with cancer. Or for cosmetic reasons in thumans, or for production of Kobe beef or Fole gras in domestic animals. Complexed (Ab) can also be used in diagnostic immunosassys for the presence of OBP. The formation of Ab-OBP complexes enables in vitro certaing weight elevals of OBP in a sample, especially to detect diseases evaluation of levals of OBP in a sample, especially to detect diseases
Obesity, mouse; OBP; leptin; hormone; body weight regulation; diabates; food intake; energy expenditure; high blood pressure; cholesterol; human; gene therapy; antibody; cancer; Kobe beef; Pole gras; immunoassay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 QQILTSMPSRNVIQISNDLENIRDLIHVLAPSKSCHLPWASGLETLDSLGGVLEASGYST 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human obesity polypeptides (OBP). This sequence has residues 18-21 mutated in comparison to the wild type sequence has residues 18-21 and AAR9720). OBP (also known as leptin) is a hormone involved in the regulation of body weight. This sequence has effects on both food intake and energy expenditure. OBP and its analogues are useful for modifying body weight (optionally combined with known medicaments), for treating clabetees, high blood pressure or high cholesterol. The DNA encoding this sequence (and sequences complimentary to it) can be used in gene therapy for modifying body weight. This protein can be used for reducing weight of modifying body weight. This protein can be used for reducing weight of animals. Antagonists of OBP (including antibodies) are useful for increasing body weight, e.g. for treating weight loss associated with cancer, or for cosmetic reasons in humans, or for production of Kobe beef cancer, or for cosmetic animals. OBP antibodies (Ab) can also be used in diagnostic immunoassays for the presence of OBP. The formation of Ab-OBP complexes enables in vitro evaluation of levels of OBP in a sample, especially to detect disasses associated with elevated or decreased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      QQILTSMPSRNVIQISNDLENLRDLLHVLAFSKSCHLPWASGLETLDSLGGVLEASGYST 120

human obesity polypeptides (OBP). This sequence has the signal peptide thuman obesity polypeptides (OBP). This sequence has the signal peptide thuman obesity polypeptides (OBP). This sequence has the signal peptide (residues 1-21) mutated in comparison to the wild type sequences (represented by AAR92719 and AAR92720). OBP (also known as leptin) is a confidence involved in the regulation of body weight. This sequence has effects on both food intake and energy expenditure. OBP and its analogues are useful for modifying body weight (optionally combined with known medicaments), for treating diabetes, high blood pressure or high cholesterol. The DNA encoding this sequence (and sequences complimentary conics on used in gene therapy for modifying body weight. This opese humans, or to produce leaner food animals. Antagonists of OBP occupations are increasing body weight, e.g. for treating weight loss associated with cancer, or for cosmetic reasons in thumans, or for production of Kobe beef or Foie gras in domestic animals. The presence of OBP. The formation of Ab-OBP complexes enables in vitro evaluation of levels of OBP in a sample, especially to detect diseases associated with elevated or decreased levels, and to monitor treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 QQILTSMPSRNVIQISNDLENLRDLLHVLAFSKSCHLPWASGLETLDSLGGVLEASGYST 120

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: May function as part of a signaling pathway that acts to regulate the size of the body fat depot. An increase in the level of LDB may act directly or indirectly on the CNS to inhibit food intake and/or regulate energy expenditure as part of a homeostatic mechanism to maintain constancy of the adipose mass (By

"Gorilla leptin genomic sequence.";
"Usualitied (CT-1996) to the EMBL/GenBank/DDBJ databases.
"Leptin genomic as part of a signaling pathway that acts to regulate the size of the body fat depot. An increase in the level of LBP may act directly or indirectly on the CNS to inhibit food intake and/or regulate energy expenditure as part of a homeostatic mechanism to maintain constancy of the adipose mass (By

Effects of insulin, body weight, and non-insulin-dependent diabetes mellitus.";

J. Biol. Chem. 271:25331(1996).

- FUNCTION: May function as part of a signaling pathway that acts to regulate the size of the body fat depot. An increase in the level of LEP may act directly or indirectly on the CNS to inhibit food intake and/or regulate energy expenditure as part of a homeostatic mechanism to maintain constancy of the adipose mass.

- SUBCELLULAR LOCATION: Secreted (Probable).

Sasaki N., Iwase M., Kimura K., Ohishi I., Saito M.;

"Molecular cloning of feline leptin cDNA.";

Submitted (APR-2000) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: May function as part of a signaling pathway that acts to regulate the size of the body fat depot. An increase in the level of LBP may act directly or indirectly on the CNS to inhibit food intake and/or regulate energy expenditure as part of a homeostatic mechanism to maintain constancy of the adipose mass (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22 VPIRKVQDDTKTLIKTIVTRINDISHTQSVSSKQRVAGLDFIPGLHPVLSLSKMDQTLAI

Submitted (JAN-1999) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: May function as part of a signaling pathway that acts to regulate the size of the body fat depot. An increase in the level of LEP may act directly or indirectly on the CMS to inhibit food intake and/or regulate energy expenditure as part of a homeostatic mechanism to maintenin constency of the adipose mass.

-!- SUBCELLULAR LOCATION: Secreted (Probable).
                                                                                                                                                                                                                                                                                                   Liefers S.C.; "Genotype effects of bovine leptin mutations on pre- and postpartum

Anim. Genet. 27:275-278 (1996).

-!- FUNCTION: May function as part of a signaling pathway that acts to regulate the size of the body fat depot. An increase in the level of LBP may act directly or indirectly on the CNS to inhibit food intake and/or regulate energy expenditure as part of a homeostatic mechanism to mainteain constancy of the adipose mass.
-!- SUBCELLULAR LOCATION: Secreted (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Sequence 6, Application US/08347563A
Patent No. 5935810
GENERAL INFORMATION:
APPLICANT: THE MCCKEFELLER UNIVERSITY
APPLICANT: THE MCCKEFELLER UNIVERSITY
TITLE OF INVENTION: ACIDS AND PROTEINS, AND DIAGNOSTIC AND THERAPEUTIC USES THERAPORDENCE ADDRESS:
NUMBER OF SEQUENCES: 38
CORRESPONDENCE ADDRESS:
ADDRESSEE: Klauber & Jackson
STREET: 411 Hackensack Avenue
CITY: Hackensack
STARE: New Jersey
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TOPOLOCY: linear
MOLECULE TYPE: protein
DESCRIPTION: Human ob polypeptide lacking Gln at position 49
                                                                                                                                                                                                                                                                                                                                                      COUNTRY: USA
